## Safety signals

Important information concerning safety is distinguished in this manual by the following notations.

**The Safety alert symbol means:**  
**Caution! Your safety is involved.**

### ⚠ WARNING!

*Failure to follow warning instructions could result in **severe or fatal injury** to anyone working with, inspecting or using the suspension, or to bystanders.*

### CAUTION!

*Caution indicates that special precautions must be taken to avoid damage to the suspension.*

### NOTE!

*This indicates information that is of importance with regard to procedures.*

## Kit contents

Before installing the front fork, please check the contents of the kit, listed in the mounting instruction. If anything is missing, contact your Öhlins dealer.

### NOTE!

*During storage and transportation, especially at high ambient temperature, the oil and grease used for assembling may run out inside the packing and damage the expanded polystyrene packing material. This is not unusual and is in no way detrimental to the shock absorber.*

## Introduction

The Öhlins front forks use a Cartridge system for damping. This gives a damping force which depends on the speed of the piston in the cartridge system.

The combination of spring and air-gap (oil level) gives a possibility to adjust the characteristic of the fork to suit different tracks and riders.

For example a soft spring in combination with a small air-gap (high oil level) gives a progressive action of the front forks.

For better understanding, please refer to our oil level chart.

A telescopic front fork is depending on a smooth friction-free action.

Make sure your front forks are serviced regularly and don't use strong solvents such as brake cleaner to clean the front forks. This will dry out the seals and steel tubes and cause friction.

Regularly, put a little Öhlins grease (148-01) on the steel tube and work it in by pushing the forks up and down.

Öhlins Racing AB can not be held responsible for any damage to spare parts or person if the mounting-, maintaining and servicing instructions are not followed exactly.

Also no guarantee can be given for the performance and reliability if these instructions are not followed.

## Setting up your forks

We would like to give you some basic guidelines, how to set up your Öhlins front forks. However you must remember that the front forks are just one part of your motorcycle and to get it to work properly, the whole motorcycle has to be set up according to your bikes manual.

### 1

Put your bike on a front stand so you can fit the front forks.

### NOTE!

*The lower triple clamp must not be tightened to more than 15-18 Nm. This is also important for the steering damper bracket, when it is located around the upper front leg. To high torque might deform the front fork leg.*

Fit the front wheel and brakes.

### 2

Unscrew the adjustment housing on top of the fork (use tool 4703-01) on both upper tubes and slide the fork up and down gentle to make sure everything works correctly.

### 3

Assemble the adjustment housing again and set your initial preload of the spring by using a 17 mm socket until you get a "static sag" of 25-30 mm.

Each turn gives 1 mm in preload, maximum preload is 18 mm.

© Öhlins Racing AB.  
All rights reserved.

Any reprinting or unauthorized use without the written permission of Öhlins Racing AB is prohibited.  
Printed in Sweden.

## 4

The best way to check the "static sag" is to put the bike on the ground in running condition.

Measure the distance between the bottom of the outer tube to the fork bottom.

Then lift the front end of the bike, so the fork is fully extended.

Take the measurement again. The difference between those two figures is "static sag".

## 5

The "clickers" are a "bleed function" separate for rebound and compression damping.

Rebound is on the top centre of the fork and compression at the bottom part of the fork.

You start to count from fully closed (clockwise) and set it to the recommended "click" (use tool 794-01).

For recommended start setting please refer to the specification card.

## Spring preload adjustment

Using a 17 mm wrench, turn the upper adjustment screw.

Maximum adjustment range is 18 mm. One turn on the adjustment screw will cause 1 mm change in spring preload.

Adjust so the front forks lowers 25-30 mm from the top, unloaded position.

## Rebound adjustment

Adjust the rebound rate on the adjustment screws positioned at the top centre of the front forks.

Use a hex key with a spherical head (use tool 794-01).

Adjustment range from closed valve (clockwise) until maximum open valve (anticlockwise) is 20 "clicks".

Recommended adjustment "click", from closed position (see specification card).

## Compression adjustment

Adjust the compression rate on the lower part of the front forks (compression valve). Use a screw driver.

Adjustment range from closed valve (clockwise) to maximum open valve (anticlockwise) is 20 "clicks".

Recommended adjustment "clicks", from closed position. see specification card.

## Changing springs

### 1

Loosen the screws that hold the fork legs in the upper triple clamps.

### 2

Loosen the top nut assembly (pos 7, page 7) about two turns (use tool 4703-01).

### 3

Remove the fork legs from the motorcycle.

### 4

Fasten a fork leg in a vice. Use soft jaws.

### 5

Unload the spring completely by turning the adjustment screw completely anticlockwise.

Use a 17 mm wrench.

### 6

Carefully loosen the top nut assembly from piston shaft

### 7

Remove the preload tube and spring. (The free spring length see page 5).

### 8

Install the new spring and check the oil level. Install the tool 1765-02 on top of the piston shaft extension. Pull out the piston rod as far as possible and turn the compression adjustment screw fully clockwise. This will keep the piston rod in top position, which will make the continued assembly easier.

### 9

Install the preload tube. Pull the piston rod out to fully extended. Push it sideways and lock the rod extensioner against the piston preload tube.

### 10

Install the top nut assembly.

### 11

Install the fork legs on the motorcycle and adjust the preload, compression and rebound according to the above instructions.

## Changing seals

Put the fork legs upright for 15 minutes.

### 1

Fasten the fork leg in a vice. Use soft jaws.

### 2

Unload the spring preload completely by turning the adjustment screw completely anticlockwise.

Use a 17 mm wrench.

Make a note of the number of turns.

### 3

Carefully remove the adjustment housing.

### 4

Remove the preload tube.

### 5

Slide the outer fork leg up until the top bushing is just above the inner leg. (Approx. 140 mm from complete bottom position).

This is to make sure there is no oil above the top bushing).

### 6

Slide the outer tube completely down. (Fork seal touching fork bottom).

### 7

Push the piston rod down so that it is in level with the top of the outer tube. Measure the oil level using the top of the outer tube as the zero mark. Note the measurement.

### NOTE!

*When measuring the oil level, always have the spring installed.*

### 8

Remove the spring and tip the oil in a clean container.

### 9

Remove the outer tube, clean the seals and check for damaged, if the seals are damaged remove and replace.

If the seals are OK, then apply with Öhlins grease (green grease 148-01).

### 10

Apply Öhlins fork oil on the seals and on the inner tube.

### 12

Carefully mount outer tube (slide completely down) install spring and set the oil level.

### 13

Go on with 9 to 11 according to "Changing springs" above.

## Dismantling the forks

**1**

Carry out 1 to 7 of page 3 "Changing springs".

**2**

Free the fork leg from the vice and drain the oil.

**3**

Pull up the outer tube and remove the seals.

**4**

Fasten the inner tube on the fork bottom in a vice. Use soft jaws!

**5**

Unscrew the seal head (pos 14, page 7) from the cartridge tube and remove the piston rod unit (use tool 1797-02). Drain the remaining oil.

**6**

Remove the complete compression valve use a 17 mm wrench.

**7**

Remove the piston and the shims from the piston rod and compression valve. Place the shims in their correct position on the work bench.

**8**

Clean all parts thoroughly and dry with compressed air.

## Assembly of the forks

**1**

Apply a thin layer of Öhlins green grease (148-01) on the scraper ring and on the sealing surfaces of the fork seal.

Install the seals in the outer tube.

Please note that it is important to use the correct grease in order to achieve optimum fork function.

**2**

Install the piston and the shims on the piston rod and the compression valve. Tighten the 8 mm lock nuts with a torque of 7 Nm.

Check the piston ring for damages. Replace if necessary.

**3**

Install the compression valve assembly into the valve housing.

**4**

Apply some front fork oil 1305-01 on the inner steel tube surface and install the outer aluminium tube.

Measure the correct amount of 1305-01 oil according to the specification card.

### CAUTION!

*Be careful not to damage the fork leg seals.*

**5**

Raise the outer tube approximately 120 mm and fill the oil.

Install the complete piston rod into the cartridge tube.

**6**

Lightly tighten the seal head using tool 1797-02.

**7**

Mount tool 1765-02

**8**

Pump the piston rod up and down and the oil will be sucked into the cartridge tube. Close the "clickers" and check the function.

**9**

Pull the piston rod out as far as possible and close the compression valve screw completely (clockwise).

**10**

Go on with 8 to 11 according to page 3 "Changing springs".

## Trouble shooting

Below are a few examples of how to adjust for the most common road holding problems in Road Racing driving.

**A**

***The front wheel "chatters" entering a corner, the problem goes away, as soon as you let the brakes off, or when you get on the power.***

This is caused by the fact that the fork is working too low in the travel and reaches the progressive, hard part at the end of the travel.

**1**

Put on more preload.

**2**

Change to a harder spring.

**3**

If a lot of stroke remains after riding, drop the oil level. See oil level chart.

**4**

Make sure the front forks have no friction.

**5**

Rear ride height is too high, too much rear spring preload.

Lower the rear end by taking off preload from rear shock spring.

**B**

***The front wheel is jumping during the last part of braking.***

**1**

If a lot of stroke remains, the oil level is too high. Lower the oil level.

**2**

If the fork is bottoming, put in harder springs and keep the oil level.

**C**

***The front end feels unpredictable and unsafe in the middle of the corner (between braking and getting on power).***

**1**

Not enough rebound damping. Put on more damping.

**2**

Too much rebound damping. If it at the same time feels harsh, take off some rebound damping.

**3**

Too much compression damping. Also gives a harsh feeling. Take off some compression damping.

**D**

***The front end loses grip coming out of a corner.***

**1**

Not enough rebound damping. Put on some more rebound damping.

**2**

Too much preload. Take off some preload.

**3**

Rear end is too soft. Put on a harder rear spring.

**4**

Front end is too high. Lower the front end by pulling the fork legs through the triple clamps.

As mentioned in the beginning, the whole bike setup affects the front forks. Try to understand the feelings and work step by step.

### NOTE!

***Our advice is to change only one thing at a time and do everything step by step.***

## Air spring characteristics FG 270

### Oil level adjustment

Compared with conventional type of front forks, the upside down front forks are very sensitive to variations in oil level. Therefore, adjust the oil level with special care.

A change in the fork oil level will not affect the damping force at the early stage of the fork travel, but will have a great effect at the later stage.

#### When the oil level is raised:

The air spring in the later half stage of travel is stronger, and thus the front forks harder.

#### When the oil level is lowered:

The air spring in the later half stage of travel is lessened, and thus the front fork softer.

The oil level works most efficient at the end of the fork travel.

Air spring characteristics shown, is a general card description to understand the difference when the oil level is changed.

#### NOTE!

**Adjust the oil level in mm according to the figure with the fork fully compressed and with the spring mounted. For the right STD-level, please see the specification card.**

### Notes

### Technical information

#### Fork length:

730 mm.

#### Stroke:

125 mm.

#### Free spring length:

240 mm.

#### Rebound adjustment:

Base setting 9-12 "clicks".

Maximum open valve 20 "clicks".

#### Compression adjustment:

Base setting 6-16 "clicks".

Maximum open valve 20 "clicks".

#### Spring preload adjustment:

0-18 mm (0-18 turns).

#### Spring rate:

4745-95, 9.5 N/mm (marking -95).

#### Optional springs supplied:

4745-10, 10.0 N/mm (marking -10).

4745-90, 9.0 N/mm (marking -90).

#### Optional springs:

4745-05 10.5 N/mm (marking -05).

4745-85 8.5 N/mm (marking -85).

4745-80 8.0 N/mm (marking -80).

4745-75 7.5 N/mm (marking -75).

4745-70 7.0 N/mm (marking -70).

4745-65 6.5 N/mm (marking -65).

#### Oil Capacity:

Please see specification card.

Use Öhlins high performance front fork fluid No. 5 (1305-01) only.

#### Loctite glue:

542 on Fork Bottom thread.

#### Tighten torque:

Triple Clamp bolt 15-18 Nm.

#### Grease:

Öhlins front fork grease 148-01 (green grease).

#### Service interval:

Every 10hours

## Spare parts
